Visual Rendered | Space Planner 3D Practical User Guide

From measured floor plan to furniture layout, materials and 3D presentation

Guide focus: a practical workflow for designing a real home/interior project. Interface images are annotated training illustrations; the workflow is based on the Visual Rendered | Space Planner 3D documentation.

1. Recommended Project Workflow

Visual Rendered | Space Planner 3D works best when you build the project in the same order that a real interior-design project is measured and executed.

Step	What you do	Output
1	Collect measurements / floor plan	Accurate reference plan
2	Set units and preferences	Correct scale and wall defaults
3	Import blueprint (optional)	Scaled background image
4	Draw walls	Accurate 2D shell
5	Add doors & windows	Openings and circulation
6	Create rooms	Room names, floors, ceilings
7	Add furniture	Realistic layout
8	Set materials & colours	Interior finish concept
9	Add levels / stairs if needed	Multi-floor model
10	Dimensions + labels	Documentation
11	3D navigation / rendering	Presentation views
12	Save / print / export	Final design package

Important: Import a blueprint when available, scale it using a known dimension, draw walls over it, add doors/windows and furniture, create rooms, and then document the design with dimensions and text.

Visual Rendered | Space Planner

--Revision – 00--

2. Understand the Visual Rendered | Space Planner 3D Screen

The desktop interface is divided into four main panes: Furniture Catalog, Home Furniture List, Home Plan and 3D View. The 2D plan is where you build the layout; the 3D pane updates as you work.

Area	Use it for
Furniture Catalog	Find doors, windows, furniture, lighting and other objects.
Furniture List	Review all objects already placed in the project.
Home Plan (2D)	Draw walls/rooms, position objects and add dimensions/text.
3D View	Check the design from an aerial or virtual-visitor viewpoint.

3. Start Correctly: Units, Scale and Blueprint

Before drawing, check the unit system, default wall thickness and wall height in Preferences. If you have an existing architectural plan, use Plan → Import background image and scale it using a known real-world length.

Practical example

Suppose the drawing contains a dimension marked 4,000 mm. During background-image scaling, align the scale line to that known dimension and enter 400 cm (or the equivalent unit shown by your settings). Do not start tracing until the background is correctly scaled.

Recommended measurement checklist

- Overall apartment width and length
- Every room's internal dimensions
- Wall thickness where known
- Door width and opening direction

Visual Rendered | Space Planner

--Revision – 00--

- Window width, sill height and position
- Columns, beams, ducts and structural projections
- Kitchen counter depth and service points
- Electrical points that affect furniture placement

Tip: if the plan is a photograph or scan, use a clearly known dimension for scaling instead of relying on image resolution.

4. Draw Accurate Walls

Use the wall-drawing tool to trace the scaled plan. Click to start, click at corners to create segments, then finish the wall sequence with a double-click or Escape. Edit wall thickness, height, colour or texture when needed.

Practical Example — 2BHK Apartment (illustration)

Note: dimensions are illustrative. Replace them with your measured site dimensions.

Practical example — 2BHK

Create the external shell first. Then add internal partitions for living/dining, bedrooms and kitchen. Keep the plan simple until all wall lengths and corners are correct. Furniture should be added only after the room geometry is reliable.

Accuracy rule: enter measured dimensions rather than estimating by mouse movement. A small wall error can create cumulative problems when cabinets, beds and circulation clearances are added later.

5. Doors, Windows and Rooms

After walls are complete, add doors and windows. When magnetism is active, dropping a door/window onto a wall helps orient it to the wall automatically. You can then adjust size and position.

Create rooms after the boundary is closed. You can create a room by clicking its corners and finishing the shape, or by double-

Visual Rendered | Space Planner

--Revision – 00--

clicking inside a closed surface. Room properties allow you to name the room and change floor/ceiling colours or textures.

Room	Suggested objects to check
Living / Dining	Sofa, TV unit, dining table, circulation
Kitchen	Base units, wall units, refrigerator, hob, sink
Bedroom	Bed, wardrobe, side tables, dressing unit
Bathroom	WC, wash basin, shower, mirror, storage
Balcony	Outdoor seating, planters, utility items

6. Add Furniture and Set Exact Sizes

Drag furniture from the catalog into the plan. Select an item to change its position, angle, size and elevation. For a real project, use the manufacturer's or site's measured dimensions rather than the default object size.

Practical example — sofa

If your actual sofa is 2,100 mm wide × 900 mm deep, select the sofa and set its dimensions to match. Then position it against the wall and inspect the 3D view for circulation. Repeat this for wardrobes, beds, dining tables and kitchen modules. Recommended placement sequence: large fixed items → large furniture → storage → appliances → lighting → decorative items.

For missing objects, Design Grid 3D can import compatible 3D models; imported objects can be given a name, size, elevation, colour and other properties.

7. Materials, Colours and Interior Finishes

Once the layout works, move from geometry to appearance. Adjust walls, floors, ceilings and furniture colours/textures.

Area	Practical design approach
Floor	Choose the actual tile/wood finish or a close texture; keep the scale realistic.
Walls	Set the main paint colour first, then add accent walls only where required.
Kitchen	Match cabinet finish, countertop, backsplash and appliance placement.
Wardrobe	Use actual laminate/finish colour and realistic door divisions.
Ceiling	Model false-ceiling drops only after room height is confirmed.
Lighting	Add light fixtures after the furniture layout is fixed.

8. Multiple Floors, Dimensions and Documentation

For a multi-storey home, add levels from Plan → Levels → Add level and model each floor separately. Add staircases where required.

Before issuing the design, add dimensions and text labels to document important measurements. This is especially useful when sharing the plan with an interior contractor.

- Overall room dimensions
- Door and window positions
- Kitchen counter lengths
- Wardrobe lengths
- Critical furniture dimensions

Visual Rendered | Space Planner

--Revision – 00--

- Ceiling heights / drops
- Notes for materials or special requirements

Practical handover: keep two versions — Working Model with all objects and details, and Presentation Model with only the information needed by the client/contractor.

9. Use the 3D View as a Design Checker

Example final 3D presentation view

Use the 3D view continuously to catch problems that are difficult to see in 2D: blocked doors, oversized furniture, awkward circulation, wrong elevations, window obstruction and unrealistic proportions.

- Check entry and door swing.
- Check clear walking paths around beds, sofas and dining chairs.
- Check that wardrobes and cabinets do not collide with doors/windows.
- Check furniture elevation and wall alignment.
- Check sight lines from the main seating position.
- Check ceiling/floor finishes and colour balance.
- Only then create final presentation views.

10. Save, Print and Export

Save the working Design Grid 3D project frequently and keep a backup copy before major changes.

Deliverable	Use
SH3D project file	Master editable design
PDF / printed plan	Measurements and contractor reference
2D image	Quick sharing / approval

Visual Rendered | Space Planner

--Revision – 00--

3D screenshots / photos	Design presentation
OBJ export (desktop)	Further 3D work in compatible software

11. Complete Practical Exercise — Design One Room

Use this exercise to learn the software without trying to model the entire house at once.

Step	Action	Result
A	Measure the room	Record internal length, width, wall thickness, door/window sizes and ceiling height.
B	Create the room shell	Set units, draw four walls and verify the dimensions.
C	Add openings	Place the door and windows in their measured locations.
D	Create the room	Name it, then set a temporary floor and wall finish.
E	Place fixed furniture	Add wardrobe, kitchen cabinets or other fixed units first.
F	Place movable furniture	Add bed/sofa/table and set exact dimensions.
G	Check circulation	Walk through the 3D view and correct conflicts.
H	Apply finishes	Add floor, wall, furniture and ceiling textures.
I	Document	Add dimensions and notes.
J	Present	Save the model and create a clean 3D view.

12. Visual Rendered | Space Planner 3D Feature Reference

This feature reference gives a quick overview of the capabilities useful for an interior-design project. Availability can differ between Desktop, Online and Mobile editions.

Category	Feature	What you can do
Planning	2D Floor Plan	Draw walls, rooms and surfaces accurately using a grid and rulers.
Planning	Blueprint Import	Import a scanned/floor-plan image and scale it against a known dimension.
Planning	Wall Editing	Change wall length, thickness, height, colours and textures.
Planning	Rooms	Create rooms, name them and customize floor and ceiling finishes.
Planning	Multiple Levels	Create additional floors/levels and connect them with staircases.
Planning	Dimensions	Add measurement lines and extension lines to document the plan.
Planning	Text & Labels	Add notes, room labels and design instructions to the plan.
Furniture	Furniture Catalog	Search and browse furniture and objects by category.
Furniture	Drag & Drop	Place doors, windows, furniture, lights and decorations directly into the plan.
Furniture	Exact Size	Adjust furniture width, depth, height, elevation and angle.
Furniture	Position & Rotation	Precisely position and rotate furniture in the 2D plan.
Furniture	Custom Models	Import additional 3D models when an object is not available in the catalog.
Materials	Colours & Textures	Customize walls, floors, ceilings and furniture with colours and textures.
Materials	Surface Finish	Change texture orientation, scale and other appearance properties where supported.
3D	Real-Time 3D View	See the design in 3D while making changes in the 2D plan.
3D	Aerial View	Review the whole home from an elevated viewpoint.
3D	Virtual Visitor	Walk through the home from a human-level viewpoint.
3D	Photo Rendering	Create photo-realistic images and customize lighting and sunlight effects.
3D	Video Rendering	Create walkthrough videos of the designed space.
3D	Lighting	Add and customize light sources for presentation and rendering.

Visual Rendered | Space Planner

--Revision – 00--

Import / Export	2D Image Export	Export plans as image files for sharing and presentation.
Import / Export	PDF / Printing	Print plans or save/print them as PDF depending on the edition.
Import / Export	OBJ Export	Export the 3D model to OBJ for use in compatible 3D software (desktop feature).
Import / Export	3D Model Import	Import compatible 3D models to expand the furniture/object library.
Productivity	Furniture List	View and manage all furniture/objects used in the project.
Productivity	Magnetism / Snapping	Automatically align objects to walls and other objects during placement.
Productivity	Keyboard Shortcuts	Use shortcuts for faster editing and navigation.
Extensions	Plug-ins	Extend Design Grid 3D functionality with plug-ins in supported desktop editions.
Presentation	Multiple Design Options	Duplicate/save versions to compare layouts, furniture and finishes.

Feature Checklist for an Interior Project

- Create/import the actual floor plan
- Set correct units and scale
- Draw accurate walls
- Add doors and windows
- Create and name rooms
- Add multiple levels if required
- Add fixed furniture and kitchen/wardrobe units
- Add movable furniture and appliances
- Set exact furniture dimensions
- Apply flooring, wall and ceiling textures
- Add lighting fixtures
- Add dimensions and contractor notes
- Review the design in 3D
- Create alternate furniture/layout options
- Create photo-realistic views
- Create a walkthrough video if required
- Print/export the 2D plan
- Save the master SH3D project and backup copy
- Export OBJ if further 3D work is required

13. Quick Reference Cheat Sheet

Need to do this	Go here / use this approach
Check units and wall defaults	Preferences
Import an existing plan	Plan → Import background image
Draw walls	Wall drawing tool in the 2D plan
Edit a wall	Select it and modify its properties
Add doors/windows	Furniture Catalog → Doors & Windows
Add furniture	Drag from Furniture Catalog to plan
Change furniture size	Select furniture → adjust dimensions/properties
Create room	Click room corners or double-click inside closed area
Change room finish	Modify room properties
Add another floor	Plan → Levels → Add level

Visual Rendered | Space Planner

--Revision – 00--

Review in 3D	3D View pane / virtual visitor
Print	File → Page setup / Print
Import a missing 3D model	Furniture → Import furniture
Export 3D model (desktop)	3D View → Export to OBJ format

Golden rule: Model accurately first, decorate second, render last.

This guide is a practical training companion and not a replacement for the official Design Grid 3D documentation.
